

Queensland Spearfishing Records 2024 & Field Guides

THIS BOOKLET IS DESIGNED TO BE PRINTED BACK-

TO-BACK SO GUIDES FACE THEIR RECORD LISTINGS. Eligible Species

By the end of the sixties the AUF & AUFQ (under its early names) had made its own list of ineligible species, as it was felt that fisheries legislation of the times did not offer some species the necessary protection. That was added to over the years. Now that fisheries legislation is much more extensive and research based, the states and the national body have reverted to our original regulations, permitting the spearing of most finfish which are legal under government regulations. Sharks & rays are not eligible. (Some) invertebrate records were started in 2021... see Part V.

31. Eligible Species:

Species of the sub-class Actinopterygii (ray-finned fishes) are eligible with the following exceptions:

- * Order Syngnathiformes Pipefish and allies, excluding the families Aulostomidae (Trumpetfishes) and Fistulariidae (Flutemouths)
- * Order Tetraodontiformes Toadfish, Boxfish, Sunfish and allies, excluding the families Monocanthidae (Leatherjackets) and Balistidae (Triggerfishes)
- 32. To be eligible for a Queensland Spearfishing Record a fish must not be protected under State or Federal Government regulations at the location where captured.
- 33. Fish must have a minimum weight of 500 grams. (Historical records weighing less than 500 grams have been retained for the sake of completeness.)

CONTENTS Use any INDEX (in the front of each finfish volume.) FINFISH Vol I

- a Index for Finfish Vol I-IV
- b Using this booklet, Who can claim
- c Suitable scales, Good photos, Cost, How to claim
- d Tied records, How small, Spearfishing area
- e Club abbreviations, A short history
- f What fish? AUFQ Regulations pertaining to The Records
- g Regulations (cont.) Acknowledgments
- 1A-7 SPEARFISHING RECORDS & IDENTIFICATION GUIDES.

P. kaakan is the larger species with a more elongate body, faint bars, often gold in the colour, and quite a long caudal peduncle. The eye is small, contained about twice in the snout length, and well below the dorsal profile. White along base of caudal fin. Small eye to snout length.

P. argenteus is smaller, and more bream like in shape. Spots are on the scales, and also can be seen on the spiny dorsal fin. The eye is large, sub-equal to snout length, and appears quite close to the dorsal profile.

PARROTFISH

Parrotfish have recently been placed as a sub-family of the wrasse. There are 26 species of parrotfish in Australian waters (only two not found in Qld.) As well, most have an initial phase (IP) which may be female or male, and a terminal phase (TP) sometimes called a super-male. The IP is often reddish, and the TP green. All parrot change from female to male, but a few species, like the Napolean Parrot, and Chlorurus frontalis, don't show two different phases. Usually colour and body shape will permit identification... show fins.

COOK'S RED SCORPION COD Scorparnia cardinalis

RED SCORPION COD, RED ROCK COD

Three species of scorpion cod found in Australia (and N.Z.) have ranges which do not overlap, making identification easy.

EASTERN RED SCORPION COD Scorpaenia jacksoniensis is only found in S.E. Qld and NSW. Also called Red Rock Cod. The Aust record is 2.551 kg Mel Brown NSW Montagau Is.

WESTERN RED SCORPION COD Scorpaenia sumptuosa is only found in W.A. from Albany to N.W. Cape. Aust record is 1.100 kg. Vin Rushworth WA. at Two People's Bay.

COOK'S RED SCORPION COD Scorpaenia cardinalis is found in Lord Howe Island, Middleton Rf, Elizabeth Rf and NZ. It grows the largest of the three.

KEY TO QLD SEA BREAM (Gymnocranius & Monotaxis)

(Also read pages 19B, 19C & 19D) 1a Sides of jaws with large flat molars, inner pectoral fin base densely scaled, denticulated ridge on outer surface
of maxilla 2
1b Sides of jaws with conical teeth (small molars in <i>G. euanus</i>), inner pectoral fin base scaleless, ridge on outer surface of maxilla not denticulated
2a Lips yellow, dark spots to membrane at base of 3 or 4 soft dorsal and anal fin rays, white bars if present at least 3-4 scales
wide, narrow but well defined red edge to the dorsal fin
2b Lips brown or reddish, no dark spots to membrane at base of soft dorsal and anal fin rays, white bars if present 1-2 scales wide, usually a yellow streak along top and bottom of caudal almost joined to form a chevron Monotaxis heterodon
3a Nape of head with distinctive "D" shaped blackish patch surrounded by a white
border, fins clear with pinkish tinge, no blue markings on face G. audleyi
3b No distinctive marking as above
 4a Longitudinal wavy blue lines on face, fins yellowish
5. Determine the least the second of the sec
5a Body noticeably longer than other sea bream (2.5 to 3 depth in SL), greatest depth of body at mid-length, blue spots/markings on face some of which are vertically elongate, dark making "eyebrow" above eye, conical teeth
at rear of jaw, snout convex (more pronounced in large fish) while profile above eye is straight giving a
hump-nosed appearance, inner surface of caudal lobes only slightly convex in small fish gradually
changing to distinctly convex in very large fish but caudal lobes still come to a point <i>G. microdon</i> (Recently described <i>G. superciliosus</i> may not be distinct from this species, so is not used here until situation is clarified.)
5b Body deep (2.4 - 2.5 depth in SL), greatest depth of body under start of dorsal fin, may have blue markings on face, snout
steeply sloping, inner surface of caudal lobes markedly convex (paddle tail) at all sizes but caudal lobes may still come to
a point
6a Body with numerous prominent randomly scattered individual black scales/spots, may be faint blue molars
markings on face, profile of head steeply sloping but almost straight, 4.5 scale rows above lateral
line under dorsal fin, small molars present on sides of jaws, eye diameter much smaller than
pre-orbital (snout) length, upper lip unremarkable and lower lip white
longitudinal rows along sides of upper body, may be some blue dots on snout, may be short blue squiggles below and behind
eye and will be iridescent shiny blue markings on scales on gill plates (cheek), dark area "eyebrow", dark bar through eye,
profile of head convex but with steeply sloping snout, 5.5 scale rows above lateral line, no molars on sides of jaws, eye
diameter large approaching or larger than pre-orbital (snout) length, upper lip reddish and lower lip white G. satoi
COMMON NAMES FOR SEA BREAM pointed teed
Monotaxis grandoculis Mu, Hump-nose Sea Bream, Large-eyed
Sea Bream(Mu is a Polynesian name referring to the large eyes.)
Monotaxis heterodonMini Mu, Narrow-barred Sea Bream, Red-finned Sea Bream
Gymnocranius audleyi Collared Sea Bream, Iodine Bream
Gymnocranius grandoculisMaori Sea Bream, Blue-lined Sea Bream, Robinson's Sea Bream
(Last name lingers from when it was G. robinsoni, don't use "Robinson's Sea Bream" on score sheets!)
Gymnocranius microdon Blue-spotted Sea Bream, Eye-browed Sea Bream
Gymnocranius euanus
Japanese Sea Bream (Last name lingers from when it was called <i>G. japonicus</i> , don't use Japanese Sea Bream on score sheets!) Gympograpius satoi Paddle toil Sea Bream Block page Sea Bream

NOTES ON SEA BREAM IDENTIFICATION

(1-2 scales wide)

Quite a deal of space is devoted to the identification of this group as it has provided more headaches than any other group. After a really close review of all the sea bream forms in our records (magnifying glass and many of the most crappy photos you can imagine), and consulting with the Qld Museum and the Australian Records Officer, there was a new identification key and a number of our records moved to a different species. There were a number of changes resulting from this in our records.

Most interesting there is only one *G. grandoculis* and one *G. euanus* anywhere in our Qld Records. Most of the claims are *G. superciliosus (previously microdon.)* Surprisingly a *G. grandoculis* was recently speared at Nine Mile off the Tweed Coast. *G. euanus* is more common on the Coral Sea reefs.

- *Scientific names and recognition of species has changed a number of times from our early records to present, and indications are that there will be more changes to come.
- *Few text books show all our species.
- *However, our five species of *Gymnocranius* are easily separable by following the key in this edition, even if their scientific names may change. A sixth species *G. griseus* also occurs in the North West.
- *The two species of *Monotaxis* can be harder to separate if they are not showing their bars and really good photos of their fins are needed.
- *The Blue-Lined Sea Bream (or Sailfin Snapper) is in the Sea Perch family and is on page 21.
- *To see more photos search the scientific names and choose "Fishes of Australia" Museums Victoria site. You can bring up more photos, but some photos are not correctly identified by contributors.
- *Eye diameter compared to pre-orbital distance often used as a characteristic for this group, but the eye appears to become relatively smaller as the fish grows.
- *Convex inner surface of caudal lobe often used as a characteristic, but at least with *G. superciliosus* the convex shape becomes more pronounced with size.
- *The much used scientific illustration of *G. microdon* by Swainston from 1989 appears to have an incorrect tail shape for our fish. Investigation of fish in SE Asia and New Caledonia have indicated there are two separate species involved, *G.microdon* and *G. superciliosus*. DNA samples of our Queensland fish should eventually provide an answer, but at present *G. superciliosus* is most likely. *So *G. supersciliosus* is here used in place of *G. microdon* until research sorts this out.

SWEETLIPS EMPERORS

Identification of the common Emperors has not caused too many problems. Spearos are much more familiar with these fish and they have had a better coverage in texts. However, in far north Old, L. microdon might be mistaken for a small Long-nosed Emperor, and there are a number of otherts not on our records. Any claims of species not already on our records must be kept until passed. **ORANGE-LINED EMPEROR** Lethrinus obsoletus Thumb print. ORNATE EMPEROR Lethrinus ornatus **BUFFALO EMPEROR** Lethrinus erythracanthus BLACK-SPOT EMPEROR Lethrinus harak GRASS EMPEROR Lethrinus laticaudis A dult fish have bright red fins and develop rounded tail tips (paddle-tail.) LONG-NOSED EMPEROR L. olivaceus Contrasting YELLOW-LIP EMPEROR white chin. L. xanthochilus Yellow lip. Often scattered dark blotches Convex profile of snout. Reddish final 4½ scale rows Often red behind lips. LONG-NOSED EMPEROR No red SMALL-TOOTH EMPEROR Lethrinus olivaceus around lips. Lethrinus microdon

L. olivaceus is the largest sweetlips emperor. Its shape is the main identification characteristic. There is another long-nosed emperor, L. microdon, in far North Qld, that could easily be confused with it. They show a number of small differences when side by side, but a clear cut difference is the number of scale rows as shown above. L. olivaceus has five and a half, and L. microdon has four and a half rows.

False fusiliers are part of the diverse sea perch family (Lutjanidae).

LUTJANIDAE

FALSE FUSILIERS

CAESIONIDAE

Fusiliers and "false fusiliers" are very similar. There are two species in our records distinguished by colour, but there are at least two other species of each in our area.

Paracaesio xanthura

For the common name we usually omit "false" and just call this species a fusilier as well.

RED-BELLIED FUSILIER

Caesio cuning

CONTACTS FOR STATE & AUST. RECORDS OFFICERS.

The Records Officer must be satisfied with the identity of the fish. At no time is it the responsibility of the Records Officer to prove the identity of the fish.

The best way to claim is to transfer the Australian fee of \$10 to the Australian Records Officer and then Email the fully completed form, fish identification photos (possibly scales and measurement photos too), to both the Australian Records Officer AND the relevant State Records Officer.
